

Mega Swing Feeder for calves

Saves money
by reducing
feed wastage

Saves time by
reducing filling
frequency

Swing Mechanism

PRICE:
\$1195.00
+ GST

As feed prices increase, it is becoming more and more important to minimize feed wastage.
Wasted Feed = Wasted Money

The Mega Swing Feeder has proven itself in the calf rearing sector and on dairy farms not only by reducing feed wastage but by reducing time spent feeding calves.

With an approximate 600kg hopper capacity, feedback from farmers has been very good in regards to time savings made in frequency of filling. A common method of filling the feeder is using bulk bags. Buying feed in bulk bags is normally cheaper than if bought in small bags. Filling the feeder using small bags is easily achieved off the trailer or truck deck.

The feed level is easily seen from a distance due to the feeders' translucent hopper. Feed is dispensed only when the calves are present to activate the pendulum therefore ensuring minimal wastage from adverse weather conditions and scavengers. If the feed does get wet, it is only a handful that gets wasted.

Ad-lib feeding means there is no specific feed time so more timid animals can access the feeder during less active times. Regulating feed intake by the calves is achieved simply by moving the adjustment lever to the desired position. There are 14 flow settings from almost free-running to complete shut-off.

The Mega Swing Feeder pictured above comfortably feeds a group of 120 calves.
